The Science Behind Semaglutide and Weight Loss

Exploring the newest advancements in full body health through semaglutide injection treatments.

At the core of regenerative medicine, the doctors at Fraum have created a world of treatments around peptides that improve your ability to “live the life you love” in almost every way: Recovery from injury or illness, muscle soreness and symptom relief, improvements to depression, mental health, sexual health and hormonal changes, and weight loss.

Previously an exclusively diabetic treatment prescription, semaglutide is changing the psychology of treating weight loss and obesity as a “chronic metabolic disease” rather than a mere lifestyle issue (with research showing a 15% weight loss in patients combining injections with physical activity and a nutritional diet compared to 2.4% in patients relying solely on the latter without semaglutide).

Semaglutide simulates the body’s GLP-1 receptors – the hormones that deliver the “full” message to the brain – mirroring appetite suppressants, slowing GLP-1 receptors that affect a patient’s ability to overeat. It slows digestive functions which then prolongs a patient’s sensation of being “full and satisfied.”

All treatments are not for all people and knowing who semaglutide would benefit and how to guide you through that process is just one of the many ways that the personal one-on-one access and attention you receive at the Fraum Center is not only beneficial, but imperative to the outcome of your care.

It's why we function the way we do and why we build relationships with our patients as you build your strength and recovery from the ailments and limitations that are holding you back from *living the life you love*.

Live the life you love,
